Provenance and AI use

Wiki *Enhanced dissipation for passive scalars*

8 November 2026

Page team: Michele Dolce · Text: [demo text]
Discuss on Zulip: #contributing, topic "Provenance and AI use".

This page records where each piece of the wiki comes from and who has checked what. The labels are explained on How to contribute. [demo text]

1 Rules

- Text drafted by Claude (AI) carries [demo text] until a member of the page team replaces or approves it.
- Arguments produced by AI systems appear only as verbatim quotations, with source and date, or as entries labelled [raw, unchecked] on Extensions and recent advances.
- The first line of each page records its team, its status and the checks made. A machine check is recorded as such and never counts as a human check.
- Statements attributed to a paper give its theorem number; synthesis proofs say which papers they follow.
- Every accepted proposal is linked, in the edit summary, to the Zulip topic where it was discussed.

2 This version

On 8 November 2026 the wiki was reorganized into the parts drawn on the map, and its pages were reduced to a skeleton, to be filled by the editorial board and contributors. The first version (6 November 2026: Couette flow with three proofs, a hypocoercivity page, the toolkit, the history) is kept in the project folder, in `archive/2026-11-06-first-version`. The only computed content is the video on the Overview, with its record on Numerical methods, made by Claude (AI) and not yet checked by a human. The TeX source of each page is generated from the wiki by a script.

3 AI-generated documents

Document	Date	Contents	Checks recorded

4 How a result becomes checked

[To be agreed with the editorial board: how many readers a proof needs before it loses its label, and whether a page records who read which proof.]
